Needs Assessment for Multi-Modal Emergency Transportation Operations with a Focus on an Aging Population

In the aftermath of disasters, evacuating aging victims and maintaining an optimal flow of critical resources to affected areas to serve their needs becomes problematic. For example, with Hurricane Katrina, fatalities were mostly aging people, with 71% of victims older than 60, and 47% over the age of 75. Figure 1 shows a mandatory evacuation order based on the lessons learned from Hurricane Katrina where the authorities ordered all the residents of Galveston, Texas, to leave the city immediately. This led to a widescale evacuation of the hospitals and nursing homes within the city using buses, ambulances and helicopters. From a transportation perspective, this problem becomes even more challenging when we consider roadway disruptions that can drastically affect emergency transportation operations.

Scanning the literature, there is no comprehensive prior work that has synthesized the requirements for a detailed multi-modal operational emergency needs assessment that could

Figure 1. A line of elderly wheel chair bound citizens in Galveston, Texas, waiting to board a bus to evacuate the city in preparation for Hurricane Rita, Sept. 21, 2005

facilitate safe and accessible evacuation of aging peopleasas and optimize the flow of critical resources into the affected disaster region to satisfy the needs of those who remain. This project describes the conceptual foundation and components necessary to create such a knowledge base with importance given to both ensuring the resiliency of the transportation infrastructure and meeting the needs of the aging population. Evaluating this comprehensive knowledge base, this project focuses on an aging victim-focused and Geographic Information Systems (GIS)-based case study application set in the District 3 Region of the Florida Department of Transportation.

Location, accessibility, and capacity attributes for intermodal origins and destinations in the affected region are identified in GIS-based maps/compatible database formats (figure 2).

Figure 3 represents an interdisciplinary action plan with an operational perspective that integrates the joint work of public, private, military, and humanitarian agencies as well as research institutes and universities.

This project also provides examples and case studies of evacuation and sheltering plans specifically addressing the needs of the aging. Figure 4 shows such a case study: an aging-focused evacuation for Panama City in Florida.

Regarding the high

percentage of aging

Figure 3. Aging-Focused Interdisciplinary Components

populations that may need evacuation and sheltering in Florida, this study highlights the following research needs that should be investigated thoroughly in order to develop solutions

It is critical to develop plans based on (a) practices that have been proven to be working in actual disaster situations and ones that need improvement, and (b) pros and cons of the individual components of emergency practices that address the specific needs of the aging urban and rural populations.

for the aging-related emergency transportation problems:

- The use of paratransit services for evacuations can be an efficient and flexible tool within the emergency disaster plans in the State of Florida. This research need is critical specifically for those aging victims that remain in the affected region as they will most probably be located at the emergency shelters.
- There is a need for special needs-oriented shelters (SPNS) that provide medical care for aging population.
- It is vital to evacuate the aging victims out of the affected disaster zone in the shortest amount of time with the most optimal route available. Therefore, there is a need for research that investigates the effects of transportation infrastructure availability, multi-modal origins and destinations, and roadway disruptions with a focus on aging. This will require the extensive use of mapping and transportation network models.
- An efficient inventory planning and supply transportation system becomes a must to ensure the survival of aging since their needs can drastically change during disaster relief operations.

Since aging victims need special assistance during emergency operations, it is expected that public and/or private humanitarian agencies will clearly benefit from this research.

About This Project

This research project was led by the principal investigator Eren Erman Ozguven (eozguven@fsu.edu), Ph.D., of the FAMU-FSU College of Engineering at the Florida State University, in cooperation with the co-principal investigators Mark Horner, Ph.D., at the Florida State University, Yassir Abdelrazig, Ph.D., and Ren Moses, Ph.D., P.E., of the FAMU-FSU College of Engineering, and Thobias Sando, Ph.D. from the University of North Florida.

This newsletter highlights some recent accomplishments and products from one University Transportation Center (UTC). The views presented are those of the authors and not necessarily the views of the Office of the Assistant Secretary for Research and Technology or the U.S. Department of Transportation, which administers the UTC program.
